C-11: the subthreshold end correction is not predicted by linear or quasi-2-D reduced models
(a) the tail is pre-asymptotic where it matters
2-D tail, ψ̂ = 12
2-D tail, ψ̂ = 30.5
zone that sets ΔL (u ≈ V_T)
local decay length (nm) [lines: λ_lin]
u / V_T (surface-potential excess)
(b) parameter-free predictions (24 states)
ΔL_pred / ΔL_2D
ΔL from 2-D (nm)
H-lin (eigen-projection): REJECTED
H-q2D (quasi-2-D, M7): REJECTED
±5 % (registered)
(c) independent solver vs DEVSIM-based ΔL
